

I. Origin and Age of the Universe

- o _____ means everything that exists in any place – all the space, matter, and energy that exists in any place.
- o It is extremely _____ and it is more than _____ billion years old.
- o _____ - states that all matter and energy started out concentrated in a small area and, after a gigantic explosion, matter began to organized into subatomic particles and atoms. The universe is still _____ today.
 - Evidence of the Big Bang Theory:
 - o There is _____ radiation (background radiation) from the explosion coming from all areas of the universe.
 - o The apparent _____ - shift of most of the galaxies.
 - The _____ Effect is the shifting of wavelengths as an objects passes. _____ - has a shorter wavelength and the object is coming towards you. _____ - has a longer wavelength and is moving away.

II. Galaxies

- o _____ are collections of billions of stars and various amounts of gas and dust held together by gravity.
- o An average galaxy has over 100 billion stars, and there are over _____ billion galaxies.
- o There are three types of galaxies based on shape:
- o Our solar system is part of the _____ Way Galaxy
 - We are part of a spiral galaxy and are located in one of the arms.

III Stars

- o A _____ is usually a large ball of gas held together by gravity that produces tremendous amounts of energy and shines.
- o Most of the energy of stars comes from nuclear fusion.
- o _____ is the combining of the nuclei of smaller elements to form the nuclei of larger elements with some of the mass being converted into energy. The sun converts Hydrogen into _____.
- o The energy of nuclear fusion is eventually radiated into space as types of electromagnetic energy.
- o _____ of a star measures how bright it would be in relation to the sun if all stars were the same distance from an observer.
- The colors change from red to blue as their temperatures _____.

Characteristics of Stars

(Name in italics refers to star represented by a ⊕.)
 (Stages indicate the general sequence of star development.)

Star Types

- _____ 90% of stars. Can find them on the broad band on the luminosity
 - o Average size stars.
 - o As the size increases, the temperature _____.
 - o As the size increases, the color changes from red to blue-white.
 - o Our Sun is a main sequence star of yellow color.
- _____ - red, orange, and yellow giant stars are a rare type of star but are commonly seen in the night sky because of their large size.
 - o Have a low temperature because they are considered to be "dying".
- _____ are very big stars that are very luminous.

- o They sometimes explode in a tremendous event called a _____.
- _____ are small (about the size of the Earth).
 - o They are sometimes colors besides white.
 - o They are hot on the surface and low in luminosity.
 - o They represent the _____ luminous or shining stage of low to medium mass stars.
- _____ happens when a white dwarf cools and no longer emits electromagnetic energy.
 - o It is a dead star.

IV Star Origin and Evolution

- Stars have an _____ (a life cycle)
- Stars originate from clouds of gas and dust molecules (left over from the Big Bang).
- _____ causes the stars to clump together (forming stars)
- When the mass is high enough, nuclear fusion starts and the star begins to shine.
- Most of the life of a star is as a main sequence star.
- Several things could happen once the star has spent its energy (depending on size):
 - Stars with masses similar to the Sun's mass become red _____, then a white _____, and then a black _____.
 - Stars with masses greater than the Sun's mass turn into Super _____, and then into a neutron star (more dense than a white dwarf).
 - Stars that are extremely massive will eventually collapse to form black _____.
 - o _____ are extreme gravity fields that allow no visible light or any other form of energy to escape.

V Solar System

- _____ - the sun and all objects that orbit the sun under its gravitational influence
- 99% of the mass in the solar system belongs to the sun.
- A _____ is any object that orbits or revolves around another object.
- There are _____ planets that orbit the Sun.
- An _____ is a solid rocky and/or metallic body that orbits the sun.
 - o They have irregular shapes.
 - o There is a known asteroid belt between Mars and _____.
 - o Are smaller than planets.
- A _____ is a body that orbits a planet or an asteroid.
 - o There are 63 known ones in our solar system.
- A _____ is often compared to a dirty snowball.
 - o Are composed of solids that turn into gases easily.
 - o They are made of substances like ice and water.
 - o When comets get near the sun, their ices turn to _____.

- Some solids are released, forming spectacular tails visible in the Earth's sky.
- _____ are very small fragments that orbit the sun.
 - Most are very small.
 - They leave a visual streak in the sky when they enter the atmosphere and are called _____.
 - If it actually touches the Earth's surface it is then called a _____.
 - Some meteorites have sufficient mass to create a depression in the Earth's crust called an _____ crater.

Evolution of the Solar System

- Scientists think that our solar system started to form approximately _____ billion years ago.
- Everything formed from a giant cloud of dust and gas that condensed (came together) into a star (the Sun) and several planets.
- Planets and moons have experienced _____ events.
 - _____ events are when meteoroids, asteroids, and comets crash onto the surfaces of planets and moons.

VI Planet Characteristics

- A planet's _____ from the sun has a major effect on its characteristics.
- Planets that are close to the sun are called _____ planets.
 - Close to the sun
 - Have relatively small _____
 - Have relatively high _____
 - Rocky surfaces have impact craters
 - Have few or no moons
 - Have no rings
 - Similar to Earth
 - Mercury, Venus, Earth and Mars (Pluto too but it's the exception)
- Planets that are far away from the sun are called _____ planets.
 - Far from the sun
 - Gaseous
 - Have relatively large _____
 - Have relatively small _____
 - Have no solid surfaces (no craters) but may have a solid core.
 - Have many moons
 - Have many rings
 - Similar to Jupiter
 - Jupiter, Saturn, Uranus, and Neptune

Solar System Data

Celestial Object	Mean Distance from Sun (million km)	Period of Revolution (d=days) (y=years)	Period of Rotation at Equator	Eccentricity of Orbit	Equatorial Diameter (km)	Mass (Earth = 1)	Density (g/cm ³)
SUN	—	—	27 d	—	1,392,000	333,000.00	1.4
MERCURY	57.9	88 d	59 d	0.206	4,879	0.06	5.4
VENUS	108.2	224.7 d	243 d	0.007	12,104	0.82	5.2
EARTH	149.6	365.26 d	23 h 56 min 4 s	0.017	12,756	1.00	5.5
MARS	227.9	687 d	24 h 37 min 23 s	0.093	6,794	0.11	3.9
JUPITER	778.4	11.9 y	9 h 50 min 30 s	0.048	142,984	317.83	1.3
SATURN	1,426.7	29.5 y	10 h 14 min	0.054	120,536	95.16	0.7
URANUS	2,871.0	84.0 y	17 h 14 min	0.047	51,118	14.54	1.3
NEPTUNE	4,498.3	164.8 y	16 h	0.009	49,528	17.15	1.8
EARTH'S MOON	149.6 (0.386 from Earth)	27.3 d	27.3 d	0.055	3,476	0.01	3.3

VII Planet Rotation

- o _____ is the spinning on an imaginary axis.
- o The _____ of rotation is the amount of time for a planet to spin 360 degrees. It is the length of one day on that planet.

VIII Planet Revolution

- o _____ is the movement around the sun in a path called an ellipse.
- o An _____ is the oval shape of a planets path around the sun.
 - Within the ellipse are two fixed points called _____.
 - The sun is at on foci and nothing is at the other.
 - _____ is the degree of ovalness of an ellipse.
 - If the eccentricity equals 1 then it would be a straight line.
 - If the eccentricity equals 0 then it would be a perfect _____.
 - You can calculate the eccentricity of an ellipse.

Find the eccentricity of the ellipse in Figure 8-14. The dots show the locations of the two foci. You will need a centimeter scale to measure the ellipse.)

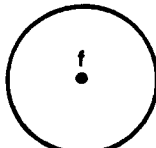

Figure 8-14.

Shapes of ellipses:

Eccentricity = 1
(a line) 

Eccentricity = 0.5 

Eccentricity = 0
(a circle) 

- The elliptical shape of planetary orbits causes the planets to vary in _____ from the sun during revolution.
 - The Earth is closer to the sun in the _____. (147,000,000 km)
 - The Earth is farthest from the sun in the _____. (152,000,000 km)
 - What causes the seasons?

- How come the Earth doesn't just fly into the sun because of the sun's gravity?
 - _____ is the concept that an object at rest will tend to remain at rest, and that an object in motion will maintain the direction and speed of that motion unless an opposing force affects it.
 - _____ is the attractive force that exists between any two objects in the universe.
 - The greater the masses of objects, the _____ the gravity.
 - The closer the objects are the _____ the gravity.
 - _____ keeps the planet near the sun while _____ keeps the planet from falling in (it keeps the planet moving in sort of the same direction).
- The _____ or revolution is the amount of time it takes for a planet to revolve around the sun.
 - It is equal to one year on that planet.
 - The closer a planet is to the sun, the _____ its orbit is, the _____ period of revolution, and the _____ its years are.

IV Apparent Motions of Celestial Objects

- _____ is a motion that an object appears to make.
 - To a person who is spinning around the room appears to move.
- _____ an object in the sky outside the Earth's atmosphere (the sun, moon, stars, and planets)
- _____ an imaginary sphere encircling the Earth on which all objects in the night sky appear.
- _____ is an uniformly curved line that is part of a circle; the path of the sun or a star through the sky.
- Most celestial objects appear to move across the sky.
 - Rising in the _____.
 - Setting in the _____.
- All motion appears to move at a constant rate:
 - _____ degrees in one day.
 - _____ degrees in one hour.
 - 1 degree every _____ minutes.
- Stars completely circle Polaris every 24 hours. They are called _____ stars.
- _____ the movements of celestial objects over a 24 hour period.

V. Apparent Motions of Planets

- o As seen from Earth the planets exhibit daily motion similar to that of stars.
- o Over _____ periods of time the planets seem to change direction in the sky.
- o The motions of planets are not uniform and are _____.
- o The planets seem to make loops, and back and _____ motions.

VI. APPARENT MOTIONS OF THE SUN

- o Like all other celestial objects the sun _____ to move through the sky.
- o Its path across the sky is in the shape of an _____.
- o The sun's path changes both in its _____ and its _____ with the seasons.
- o Within the continental United States
 - o The sun is _____ in the sky (72 degrees in altitude) in the summer.
 - o The sun is _____ in the sky (28 degrees in altitude) in the winter.
 - o The noon sun is _____ directly overhead.
- o The sun is always at its _____ position in the sky at local solar noon.

- o _____ - the time at which the sun reaches its highest point in the sky.
- o _____ - time based on the rotation of Earth as reflected in the motions of the sun.
- o The noon sun is only directly _____ for an observer within the tropics.

XII

Geocentric Model of the Solar System

XIII

Heliocentric Model of the Solar System

XIV

Evidence of the Earth's Rotation

- o The _____ pendulum.
 - When the pendulum is allowed to swing freely its path will appear to change in a predictable way.
 - This is an evidence of the Earth's rotation because the pendulum – due to _____ - would continue to swing in the original path if the Earth didn't rotate.

- o The _____ effect.
 - It is the tendency of all particles of matter moving at the Earth's surface to be deflected, or curve away, from a straight-line path.
 - o _____ in the Northern Hemisphere
 - o _____ in the Southern Hemisphere
 - This _____ occurs because the Earth is rotating, and therefore the Earth's surface is moving with respect to the path of the particles.

XV

Evidence of the Earth's Revolution

- o The changing _____ are proof.
 - Because we revolve around the Sun, the two poles are tipped towards the sun at different times of the year.
- o Looking at the _____ is proof.
 - A _____ is a group of stars that form a pattern and are used to help people locate celestial objects.
 - We can see different constellations each season because we are in different parts of the solar system.
- o The _____ diameter of the sun appears to change throughout the year.
 - _____ diameter is how big it appears to be.
- o Small changes in the color of stars.
 - _____ - means we are moving away.
 - _____ - means we are moving toward.

XVI Time

- o _____ is the time it takes for the Earth to rotate from solar noon to solar on two successive days.
- o _____ is a type of time that is based on the actual motions of the sun in the sky. (23hrs 56min)
- o _____ is exactly 24 hours.
- o _____ has been divided to make 24 hours a day for the convenience of time keeping.

XVII Actual Motions of the Earth's Moon

- o The revolution of the moon around the Earth (as the Earth revolves around the sun) results in many common observable events.
- o The moon revolves around the Earth in an elliptical orbit that is tilted about 5° from the Earth's orbit.
- o The moon orbits the Earth once every _____ days.

XVIII Phases of the Moon

- o Half of the moon is always receiving _____ from the sun at any given time (except for lunar eclipses).
- o Since the moon revolves around the Earth, an observer on Earth sees varying amounts of this lighted-half.
- o _____ are the changing amounts of the lighted moon as seen from the Earth.
- o The moon takes _____ days to revolve around us once.
- o It takes _____ days for the moon to complete one complete cycle.
 - An extra _____ is needed to catch up to the same spot on the Earth.

Earth and moon as viewed from space (looking down on the North Pole)

Time in days for one phase cycle Phases as viewed from earth

0		1 New
3 3/4		2 New crescent
7 1/2		3 First quarter
11 1/4		4 New gibbous
14 1/2		5 Full
18 1/2		6 Old gibbous
22 1/2		7 Third quarter
26		8 Old crescent
29 1/2		1 New

~~XIV~~ Tides

- o _____ are the cyclic rise and fall of ocean waters
- o they are caused by the gravitational attraction of the _____ and _____.
- o Ideally there should be 12 hours and 50 minutes between each high tide.

~~XX~~ ECLIPSES

- o _____ is when a celestial object partly or completely comes into the shadow of another celestial object.
- o A _____ occurs when the moon's shadow falls on a small part of the Earth and blocks out the sun.
 - It is very rare for a total eclipse of the sun (once every 200 years) and it only affects a small part of the Earth since the Moon's shadow is so small.
 - A total eclipse will only last for 7 ½ minutes.

- o A _____ is when the Earth's shadow covers the moon.
 - It is more common, 2 total eclipses a year.
 - A total eclipse will last for over 100 minutes.
 - All the people on the dark half can see the eclipse.

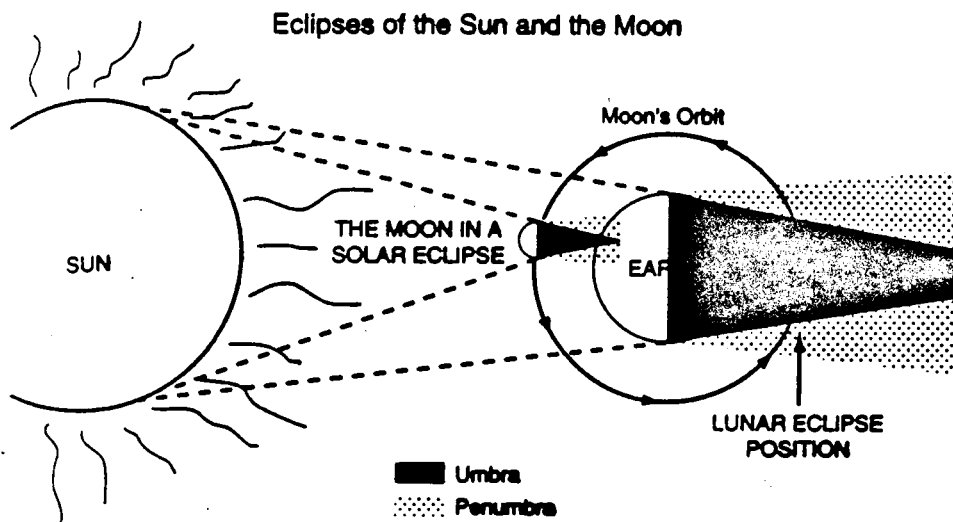

Figure 8-9. Eclipses of the sun and moon as observed from a position high above the North Pole. Eclipses of the sun fully darken a small area on the Earth. Eclipses of the moon are visible from a much larger area of the Earth.

XVI Seasons

- o The sun's path through the sky changes with the latitude and the season because:

-
-
