

UNIT OVERVIEW: Students are introduced to the nature of light, glass, and the interplay between the two in order to understand how optical elements are designed and assembled together to create quality images. Students will understand optics and engineering content, which is embedded throughout the year, so that students build on the fundamentals of advanced manufacturing processes learned in Precision Optics I. Students develop habits of mind and skills necessary to manufacture, test, and evaluate a finished good, based on customer specifications.

STAGE ONE: Identify Desired Results					
Established Goals/Standards	Established Goals (CDOS)	Long-Term Transfer Goal			
	Standard 1: Students will be knowledgeable about the world of work [...] and relate personal skills, aptitude and abilities to future career decisions.	<i>At the end of this unit, students will use what they have learned to independently... examine ray diagrams for several optics systems and evaluate and compare the predicted image quality created by each optic with special attention paid to the type and severity of first order aberrations. Students will construct an illustrated essay. This essay will indicate the student's level of understanding about how lenses are designed to control light.</i>			
	Standard 2: Students will demonstrate how academic knowledge and skills are applied in workplace and other settings.	Meaning			
	Standard 3a: Students will demonstrate mastery of the foundation skills and competencies essential for success in the workplace.	<table border="1"> <tr> <td>Enduring Understandings <i>Students will understand that...</i></td> <td>Essential Questions <i>Students will consider such questions as...</i></td> </tr> <tr> <td> <ul style="list-style-type: none"> • Optics is the science of controlling light. • Simple rays are used by engineers and lens designers to illustrate the path of light through an optic. • The performance of a lens (system) depends on each lens' shape, orientation, glass type, and alignment within the system. • Real lens systems are designed to minimize deviations from ideal, but every system creates images with some degree of aberration. </td> <td> <ol style="list-style-type: none"> 1. How do we choose the right optic to make light do what we want? 2. Why does curve and composition of the glass matter? 3. What can we "get away with" when designing optics? 4. How do optical designers maximize the performance of an optical system? </td> </tr> </table>	Enduring Understandings <i>Students will understand that...</i>	Essential Questions <i>Students will consider such questions as...</i>	<ul style="list-style-type: none"> • Optics is the science of controlling light. • Simple rays are used by engineers and lens designers to illustrate the path of light through an optic. • The performance of a lens (system) depends on each lens' shape, orientation, glass type, and alignment within the system. • Real lens systems are designed to minimize deviations from ideal, but every system creates images with some degree of aberration.

- *Law of Refraction (Snell's Law) at air-glass boundaries.*
- *Index of refraction is a measure of a glass's optical density and degree to which it can bend light.*
- *The lens maker's equation ($\phi = [n-1][1/R_1 - 1/R_2]$) is used to determine a theoretical focal length of a lens based on the radii of curvature and index of refraction.*
- *Dispersive index is a measure of a glass's ability to diffract light differently according to color (dispersion).*
- *A glass map is a 2-D organization of glass types according to index of refraction (at 589.3 nm) and dispersive index.*
- *Positive lenses cause light to converge. Negative lenses cause light to diverge.*
- *Lenses can be convex, concave or meniscus.*
- *Optical engineers use ray diagrams to describe the motion of light through an optical system.*
- *Marginal, paraxial, and chief rays are drawn to show different aspects of light's motion through an optical system.*

STAGE TWO: Determine Acceptable Evidence

<u>Evaluative Criteria</u>	<u>Assessment Evidence</u>
<p>(T) Examine a series of ray diagrams for different lens systems and compare/comment on the predicted quality of each lens' image.</p> <ol style="list-style-type: none"> 1. (A) How completely does the student know the EM spectrum? 2. (A/M) How well can a student characterize what happens when rays of light strike a plane surface? 3. (A/M) How well can a student characterize what happens when rays of light strike a curved surface? 4. (A) How well can a student ID a lens type and function based on its shape? 5. How well can a student interpret a glass map? 6. (A) How completely can a student manipulate the lens maker's equation to predict the power and focal length of a given lens? 7. (M) How well can a student identify aberrations based on ray diagrams? 8. (T) How effectively can a student weigh pros and cons to determine the best fix for a given aberration? 9. 	<p>Performance Tasks:</p> <p>Characterize the elements in an optical system and evaluate the design choices based on the types of aberrations that exist in a ray diagram sketch.</p> <p>Other Assessment Evidence:</p> <ol style="list-style-type: none"> 1. EM spectrum inventory. [What is light?] 2. Snell's Law & reflection experiment with rectangular prisms. [How does light interact with matter] 3. Snell's Law experiment and light through concave and convex prisms. [How does light interact with matter?] 4. Illustrated Essay #1: What happens when light hits an air-glass boundary? 5. Lens shape and lens function identification worksheet. [Why does curve matter?] 6. Dispersion demo & glass map interpretation assignment. [Why does composition matter?] 7. Lens Maker's Equation worksheet and Excel spreadsheet. [Why does curve & composition matter?] 8. Ideal Ray Diagram reading and questions. [What can we get away with when designing optics?] 9. Real Ray Diagrams & Lens Aberrations interpretation worksheet. [What can we get away with when designing optics?] 10. Lens aberrations corrections worksheet. [How do optical designers maximize the performance of an optical system?] 11. Illustrated Essay #2: What variables impact image quality and what choices determine the final lens design? [What can we get away with when designing optics?]

Subject: **Precision Optics II** Grade: 10-11 Unit #: 1 Title: **Lens Function & Design**

Code	STAGE THREE: Plan Learning Experiences	
	Learning Events:	Evidence of learning: <i>(formative assessment)</i>
A	1. Investigating the EM spectrum: interactions between light and matter.	1. Analyze a situation and identify the type of EM radiation at play.
A	2. Light's journey from air into and out of glass: What happens at the boundaries and in the bulk?	2. Qualitatively predict the path of light from air into glass and back into air and predict light's path when it reflects at a surface.
A/M	3. Law of Reflection & Snell's Law 'plane' experiment.	3. Accurately discuss and illustrate the principle of dispersion and the dispersive index of glass.
A/M	4. Law of Reflection and Snell's Law 'curved' experiment	4. Correctly identify glass types based on refractive and dispersive indices.
M	5. Identifying a lens type based on shape.	5. Comparing and contrasting properties of two glass types from given glass codes.
A	6. Fill in the box "before and after" light beams.	6. Calculate lens power and focal length from curvature and glass code.
M	7. Experiencing the dispersion of white light through prisms.	7. Match the change in light ray paths with the appropriate lens shape.
A/M	8. Reading and interpreting a Schott Glass Map and glass codes.	8. Match the correct aberration with ray diagram.
A	9. Comparing and contrasting two optical glass types.	
A/M	10. Lens Maker's Equation by hand and with Excel.	
M	11. Ideal Ray Diagram reading.	
A	12. Real Ray Diagrams lecture.	
M	13. Introduction to lens aberrations.	
A/M	14. Correcting lens aberrations.	
T	15. Evaluating lens choices based on aberrations.
